PROBLEM STATEMENT

We want to compare SSC percentages between students from Central boards and Other boards to see if one group consistently performs better, or if performance is similar across both.

CHART

WHAT DOES THE CHART SHOW

This is a Grouped Box Plot. It compares SSC percentages across Central and Other boards, while also showing differences between males and females in each group.

EXPLAIN THE BOX PLOT (PARTS)

- 1 Line inside box = Median (typical score).
- 2 Box = Middle 50% (Q1-Q3) → consistency of scores.
- 3 Whiskers = overall spread of scores.
- 4 Dots outside whiskers = Outliers (unusually high/low performers).

INSIGHTS FROM GRAPH

Median

- In Other Boards, females score higher (median ~75%) than males (~65%).
- In Central Boards, females also slightly outperform males.

Spread

- Males → wider spread, more variation.
- Females → narrower spread, more consistent.

Pattern

Gender differences are more visible than board differences.

Outliers

One low outlier in Other Board Female.

TAKEAWAY

The data suggests that gender has a stronger influence than board type. Females show more consistent and higher SSC performance across both Central and Other boards, while males show more variation.

THANK YOU
